

DC Collection Network Simulation for Offshore Wind Farms

S. Vogel, T.W. Rasmussen, W.Z. El-Khatib, J. Holboell Technical University of Denmark, Denmark – stevog@elektro.dtu.dk

Abstract

This work provides a study about the simulation of a medium voltage DC grid in an offshore wind farm [1]. The behavior in steady-state and during fault conditions is investigated. The efficiency of the network is determined in full-load conditions. Furthermore, key design aspects of such a grid are illustrated and issues regarding ripple current and converter design are treated.

Objectives

 \succ Steady-state simulation of an offshore wind farm with a 30 kV MVDC grid connected with a HVDC model to an AC grid

Results

Voltage stable but distorted current output in MVDC grid due to a lack of inductive components such as 50 Hz transformers!

Current flow - 30kV DC Grid - Current I1 and I4

- > Highlight operational characteristics of a MVDC grid
- > Show the voltage/current behavior during fault conditions

> Calculate the efficiency

Schematic of an offshore DC grid with parallel bus design, HVDC link, grid representation and control strategies responsibilities.

Methods

Representation of components with electrical models Focus on DC/DC converter structure and control

0.55 0.552 0.57 0.554 0.556 0.558 0.56 0.562 0.564 0.566 0.568 time [s]

Current ripple in two different positions in the grid without damping measures.

How to reduce the ripple current?

3. Different Converter Design

Fault analysis with reduced ripple current – SC in WT1

Wind Turbine Converter Fault-Bus Voltage and Fault Currents-WT Terminal 1

> Implementation in EMTDC PSCAD, 4 Wind Turbines

Dual active bridge (DAB) DC/DC Converter design controlled by dual phase shift (DPS) [2] control mode. Modular structure of converter to decrease conduction losses, improved transformer efficiency and voltage sharing on medium voltage stage. High input and output ripple current needs to be taken into consideration [3].

Additional Components

Type/Model

Generator	Synchronous Gen.	Torque Control
AC/DC Low Voltage Conv.	Diode Bridge Rectifier	Passive
DC/HVDC High Voltage Conv.	Boost Converter	Voltage regulator
HVDC/AC High Voltage Conv.	Two-level-Full bridge IGBT	DQ0 - PWM
MVDC Cable Model	PI-Equivalent	None
HVDC Cable Model	Frequency Depended Phase Model	None

Short circuit in wind turbine, location of fault indicated in grid overview.

Conclusions

- \succ DAB DC/DC Converter with high nominal input and output current ripple
- \succ The MVDC grid needs to be stabilized with additional inductances and/or control strategies
- \succ Due to low inductance, very fast DC breakers (t_{br}=1...1.5ms) [4] are essential to limit short circuit currents
- > Grid efficiency is found to be 94.4% (Calculation includes) conduction and switching loss of: diode rectifier, DAB converter, MVDC cables)
