

## Press Release

---

A/S Megatrade Beslag

2 March 2015

## Focus on Safety Hatches in Wind Turbines

**At EWEA Offshore 2015 in Copenhagen, A/S Megatrade Beslag will present its portfolio of services for the offshore wind industry, together with a display that shows how to close a hatch in a safe and responsible way. (Hall E, Stand D-2).**

Through our daily contact with the wind and offshore industry, we experience how safety regulations continuously are updated and optimized. Especially the service personnel's movements inside the wind turbine in connection with service are in great focus.

The "hatch-simulator" is one of many potential solutions, on how to solve the challenges of creating a safe work environment inside the wind turbine. The simulator focuses on demonstrating following features:

- A smooth movement in the entire closing motion
- The hatch closes slowly, so that service personnel can move safely backwards down the stairs, without any risk of getting the hatch down on them
- The hatch will at all-time not be left open, but automatically close itself
- The slow damping movement of the hatch prevents the service personnel from accidently getting fingers or other body parts entrapped

We look forward to show you our display and safety features
